is the maximum normal stress at the extreme fiber;  $y$  is a distance in  $y$  from the n.a.;  $M$  is the bending moment;  $I$  is the moment of inertia;  $S$  is the section modulus.

Lecture 8 " Bending & Shear Stresses on Beams Beams are almost always designed on the basis of bending stress and, to a lesser degree, shear stress. Each of these stresses will be discussed in detail as follows. A) Bending Stresses A bending stress is NOT considered to be a simple stress. In other words, it is not load divided by area.

Chapter 5 Stresses in Beam (Basic Topics) 5.1 Introduction Beam : loads acting transversely to the longitudinal axis the loads create shear forces and bending moments, stresses and strains due to  $V$  and  $M$  are discussed in this chapter lateral loads acting on a beam cause the beam to bend, thereby deforming the axis of the beam into curve line, this is known as the deflection curve of the beam ...
